Tijhuis Ingenieurs

Sustainable advice in and around the water

We are the experts in sustainable regional water management in the Netherlands.

Water (bed) quality

Water (bed) quality is at the core of our work. A clean water bed is the foundation of a well-functioning water system. Tijhuis Ingenieurs wants to be a leader in the sustainable management of regional water systems, now and in the future. That is why we identify where there are opportunities to improve water quality, ecology and management.

As advisers and connectors, we bring parties together and work towards healthy water systems that contribute to a sustainable living environment.

Nature

Ecology and biodiversity are the foundation of a healthy water system. Drawing on our expertise, we work on projects that contribute to a colourful living environment. We support the construction of nature-friendly banks and strengthen the connection between the water bed and nature. We believe in meaningful work: building together towards a future in which nature and water reinforce each other.

Empowered

The wellbeing, safety and development of people are central to our work, from our own employees to local residents and users of the areas in which we work. We believe that sustainable impact begins with people who feel good about themselves and feel connected to their surroundings. By making room for development, initiative and collaboration, we strengthen each other and the quality of our work.

Climate impact

Reducing our climate impact calls for conscious choices. In our projects and within our own organisation, we focus on sustainable energy sources, efficient working methods and limiting CO2 emissions. In doing so, we keep a close eye on developments in the sector and translate new insights into practical applications. In this way, we contribute to a sustainable future and continue to look ahead.

Reducing energy consumption through smart, efficient choices

Using renewable energy, such as solar, wind and hydropower

Reducing energy consumption through smart, efficient choices

Creating as many biodiverse, nature-friendly banks as possible

Strengthening and restoring habitats for plants and animals

Making use of both small and large interventions to give nature space in our projects and in and around our office locations

Safeguarding and improving water and water bed quality

Future-oriented, data-driven management and monitoring

Integrated solutions at the interface of water, bank and land

High-quality, circular handling of dredged material

Smart reuse of released materials in banks and structures

Sustainable employability, job satisfaction and balance for our employees

Social involvement, recreation and experiencing nature in the living environment

Offering opportunities to people who are distanced from the labour market

Minimising environmental impact through design, reuse and local application, both within our projects and for our own organisation

Knowledge sharing, both internally and externally

To achieve our sustainability ambition, we focus on the following aspects:

Sustainability is embedded in all Tijhuis Ingenieurs projects.

Sustainability runs through the veins of all Tijhuis Ingenieurs employees.

Empowered at Tijhuis Ingenieurs: Tijhuis Ingenieurs as a sustainable employer.

Sustainable insights through WIT

With the water bed information system WIT, we translate field data into realistic, well-founded multi-year plans. We bring structure and strategic insight to complex management and maintenance issues and support clients in making well-considered choices. In this way, we steer towards quality, sustainability and long-term results.

Materials

Materials and raw materials deserve a second life. What is often seen as a residual stream, we see as a valuable raw material. By handling dredged material and other materials in a circular way, we create added value in our projects. With an eye for practical implementation, we reuse materials where they deliver the greatest return. In this way, valuable streams contribute to the restoration of nature and the sustainable use of raw materials.
