Review of sustainability ambition

Introduction

Sustainable advice in and around water is not a promise; it is what Tijhuis Ingenieurs does. At a time when climate, raw materials and biodiversity are under pressure, we choose progress that you can see in the landscape and in our results.

We are pioneers: we investigate, connect and deliver. That is why we make sustainability tangible, both in our projects and in our organisation. With this approach, we work together every day towards our goal on the horizon: to be the expert in sustainable regional water in the Netherlands.

"We do this for future generations and for the nature of today and tomorrow. By creating the right space for nature and restoring it, we add lasting value. This is where our strength lies."

What we do it for

Why?

Climate change is not an abstract story, but a daily reality in our work. We see at first hand how water, soil and nature are increasingly under pressure, and this calls for conscious, future-proof choices. At Tijhuis Ingenieurs, we believe that water beds, data, innovations and nature make each other stronger: sustainability is not an additional task, but the standard on which we advise, design and manage.

In doing so, we look beyond "less impact". We work from the principle of restorative value: how can our projects not only limit damage, but actively contribute to the restoration of landscapes, water quality and biodiversity, and add value to the surrounding area?

Every day, we continue to build on our role as an expert in sustainable regional water. With a future-oriented and data-driven approach, we make clear what works, substantiate our choices and steer towards demonstrable improvement in management and implementation. After all, it is the sum of smart, feasible interventions that makes the difference. For today and for the generations after us. That is who we are, and what we stand for.

Ambition

"Tijhuis Ingenieurs is the expert in sustainable regional water in the Netherlands"

Tijhuis Ingenieurs is a leader in delivering future-proof water systems. Drawing on our expertise in regional water management, we actively contribute to making the dredging sector more sustainable, with a focus on improving the water bed and water quality, adding nature-restoring value and using raw materials circularly.

How do we achieve this?

To realise our sustainability ambition, we focus on a way of working that suits who we are. We work professionally and with an eye for quality: technically strong, careful and focused on solutions that stand the test of practice.

We are open and transparent about trade-offs and results: we make our choices clear and, wherever possible, substantiate them with knowledge and data, using WIT – the water bed information system of the Netherlands.

We do this together and in an integrated way, because sustainable choices emerge at the intersection of disciplines, interests and collaboration with clients and partners.

Above all, we are connectors: we bring people and challenges together, we share knowledge, we inspire enthusiasm and we translate ambition into concrete steps with lasting impact.

Themes

We make our sustainability ambition concrete through a number of interrelated themes. These themes guide our choices in projects, partnerships and within our own organisation. They help us to sharpen our focus, increase our impact and work step by step towards restorative value for people, water and landscape.

Together, the themes form the framework within which we continue to work sustainably, with an eye to the future and a commitment to quality.

Nature

In your strength

Water (bed) quality

Climate impact

Materials

Water (bed) quality

Water (bed) quality is at the heart of our work. A clean water bed is the foundation of a well-functioning water system. Tijhuis Ingenieurs aims to be a frontrunner in the sustainable management of regional water systems, now and in the future. We therefore identify where opportunities lie for improving water quality, ecology and management.

We focus on:

• safeguarding and improving water quality and water bed quality;

• future-oriented, data-driven management and monitoring;

• integrated solutions at the interface of water, banks and land.

As advisers and connectors, we bring parties together and work towards healthy water systems that contribute to a sustainable living environment.

Nature

Ecology and biodiversity form the basis of a healthy water system. Drawing on our expertise, we work on projects that contribute to a colourful living environment. We support the construction of nature-friendly banks and strengthen the connection between the water bed and nature. We believe in meaningful work: building together towards a future in which nature and water reinforce each other.

We are committed to:

• creating as many biodiverse, nature-friendly banks as possible;

• strengthening and restoring habitats for plants and animals;

• making use of both small and large interventions to give nature space in our projects and in and around our office locations.

A little bit of nature is still nature. Together, we are taking steps that make a difference.

Materials

Materials and raw materials deserve a second life. What is often seen as a residual stream, we see as a valuable raw material. By handling dredged material and other materials in a circular way, we create added value in our projects. With an eye for practical execution, we reuse materials where they deliver the greatest return.

The focus is on:

• high-quality, circular handling of dredged material;

• the smart application of released materials in banks and structures;

• minimising environmental impact through design, reuse and local application, both within projects and for our own organisation.

In this way, valuable streams contribute to the restoration of nature and the sustainable use of raw materials.

Climate impact

Reducing our climate impact calls for conscious choices. In projects and within our own organisation, we focus on sustainable energy sources, efficient working methods and limiting CO2 emissions.

Our focus is on:

• reducing energy consumption through smart, efficient choices;

• using renewable energy, such as solar, wind and hydropower;

• making the impact in our projects visible and raising awareness.

In doing so, we closely follow developments in the sector and translate new insights into practical applications. In this way, we contribute to a sustainable future and continue to look ahead.

In je kracht

The well-being, safety and development potential of people are central to our work. This applies to our own employees, as well as to local residents and users of the areas in which we work. We believe that sustainable impact begins with people who feel good about themselves and feel connected to their surroundings.

We focus on:

• sustainable employability, job satisfaction and balance for our employees;

• social involvement, recreation and the experience of nature in the living environment;

• providing opportunities for people who are distanced from the labour market;

• knowledge sharing, both internally and externally.

By making room for development, initiative and collaboration, we strengthen one another and the quality of our work.
