INTRODUCTION

'Tijhuis Ingenieurs – Sustainable advice in and around water.'

The climate is changing, and this affects all of us. In the Netherlands, we are increasingly faced with major floods and wildfires. During our summer holidays we walk along dried-up rivers, and during winter sports holidays we increasingly see green mountains. Moreover, the way we currently live and consume leads not only to climate change, but also to a shortage of raw materials, the extinction of animal species and a host of other problems.

To tackle these problems, we must treat the earth and its raw materials more intelligently and more carefully. For this reason, targets have been set at both international and national level. Tijhuis Ingenieurs also takes its responsibility and is actively working on sustainability, in order to contribute to combating climate change.

AMBITION

"By 2030, Tijhuis Ingenieurs will be the expert in sustainable regional water in the Netherlands."

To realise our sustainability ambition, we focus on the following aspects:

Sustainability is embedded in all Tijhuis Ingenieurs projects.

Sustainability runs through the veins of all Tijhuis Ingenieurs employees.

In your strength at Tijhuis Ingenieurs: Tijhuis Ingenieurs as a sustainable employer.

WIT strengthens sustainability through quality and knowledge assurance.

Tijhuis Ingenieurs is working towards a sustainable world of tomorrow, on the one hand to make the Netherlands more beautiful for present and future generations, and on the other to remain relevant in the market.

Through our primary process, we contribute to a more sustainable society in the form of sustainable watercourses. As Tijhuis Ingenieurs, we want to minimise the consequences of climate change and set an example by focusing on making our own organisation more sustainable.

In collaboration with PHI Factory and internal stakeholders, we first determined the sustainability ambition, objectives and strategy for Tijhuis. We then used this goal on the horizon as a starting point to define opportunities that contribute to achieving the stated ambition and objectives. In this action plan, the opportunities have been further developed and translated into practice.

WHY

Ambition document Tijhuis Ingenieurs

SUSTAINABILITY | 2023

We are pioneers: we investigate, connect and realise!

Value Wheel

Ambition Document Tijhuis Ingenieurs

SUSTAINABILITY | 2023

This value wheel is the sustainability model with which Tijhuis Ingenieurs will realise its ambitions up to 2030. The value wheel presents the various themes in a single overview.

Materials

Ecology

Water (bed) quality

In your strength

Energy

2030

OBJECTIVES

We have jointly set objectives for each theme. The opportunities we have identified contribute to achieving these objectives and thereby to the sustainability ambition of Tijhuis Ingenieurs.

ENERGY

Objectives for 2025:

• In 2025, we will offset our CO2 emissions in our projects.

Objectives for 2030:

• By 2030, we will be 100% CO2 neutral in our own business operations (scope 1, 2).

• All of our specifications will address their CO2 footprint and encourage the market to become more sustainable.

• Our WIT software will contain sustainable dredging plans from 10 water boards and 50 municipalities.

MATERIALS

Objectives for 2030:

• All dredged material will be processed as sustainably as possible.

• We will use a maximum of 50% primary raw materials in our projects.

• We will use primary raw materials in our business operations only when there is no alternative.

• All of our sampling packaging will be made from secondary raw materials or will be part of a chain.

IN JE KRACHT

Objectives for 2030:

• Our employees are happy and are, both literally and figuratively, in the right place at Tijhuis.

• Our employees are healthy (<1.5% sickness absence).

• We are socially engaged and improve the living environments around our offices.

• We offer internships and help people get started in the labour market.

• In all their work, our employees ensure a good experiential value of water.

ECOLOGY

Objectives for 2030:

• We disturb nature as little as possible in all our activities and projects.

• In all our activities, we pay attention to improving biodiversity and carry out an opportunities analysis with WIT Waterpaspoort.

• We prevent the spread of invasive exotic species.

• We contribute to improving the quality of the area.

WATER (BED) QUALITY

Objectives for 2030:

• All our dredging project preparations address the improvement of water quality.

• Each year, we investigate at least 20 water (bed) quality issues.

• We are at the forefront of research into and advice on new problematic substances.

• We are the go-to party for policymakers on this theme.

• Through dredging, we contribute to improving the quality of the entire area.

• WIT is the system in the Netherlands used by water managers to achieve and safeguard their sustainability ambitions.

SUSTAINABILITY | 2023

STRATEGY

Motivation

The employees of Tijhuis Ingenieurs are intrinsically motivated to get to work on sustainability and want to set an example; they want to be progressive, connecting makers.

Horizon

The objectives to be achieved are set for 2030, with an interim step in 2025 in order to have concrete short-term objectives.

Focus

Within the sustainability drive at Tijhuis Ingenieurs, the focus is on practically achievable solutions, with sufficient attention also given to communication and visibility.

Approach

Within Tijhuis, many small, solid initiatives are already being developed, and increasingly work is also being done on flagship projects.

Responsibility

Responsibility for realising the ambition lies with the management. Within the organisation there are various ambassadors who contribute to the sustainability ambitions.

PRECONDITIONS

Ambition document Tijhuis Ingenieurs

SUSTAINABILITY | 2023

Direction

To put the sustainability ambition into practice, an interdisciplinary sustainability team will be established. In addition, 'it is not accepted that you are not working sustainably'.

Costs

Developing towards the achievement of the ambitions may entail investments, provided the business case is profitable in the long term.

Resources

Various resources are deployed to achieve the sustainability ambitions. We are focusing on communication; knowledge and capacity are largely present, but this is not (yet) known within the organisation.

Challenge

The biggest challenge is that sustainability is still often a non-binding theme; the sustainability ambition must be embedded in the organisation. In addition, we need to get to work on convincing some clients.

Tijhuis Ingenieurs wants to invest in order to become *the* sustainability expert in the field of sustainable regional water management, but money also has to be earned. In every decision, the

right balance between sustainability and profitability is sought. We focus on topics where we can achieve a return.

Sustainability made transparent by WIT

Everything has been made transparent through data. We know exactly what is going on in a management area, where the opportunities lie, and how we will put this into practice together with the client. Tijhuis Ingenieurs has developed *the* online management system to support dredging maintenance: WIT. This application has been built for the collection, processing, analysis, visualisation and storage of all water bed information. WIT is used as a tool to monitor the sustainability objectives.
