Control of dredging planning with the online management system WIT

1. Input

2. Analysis

3. Planning

4. Execution and data collection

5. Updating

From input to insight

The basis for the system is a GIS layer of line segments representing the watercourses. Information on the maintenance depth is linked to each watercourse. By entering cross-sections in WIT, the maintenance status becomes clear. The WIT system calculates the year in which the profile will no longer meet the specified maintenance depth. This assists the manager who determines the maintenance year for the watercourses.

After new key figures are entered, WIT readily shows the consequences for quantities and costs. When the planning is changed, WIT likewise immediately calculates the new quantities and costs. Information on quantities, quality, planning and costs is visualised on a map and displayed in profiles and tables. The data can be exported to various file formats.

WIT gives you control of dredging planning.

M3

How does it work?

1. Input: entering the geometry of watercourses and cross-sections, and calculating the dredging year using criteria.

2. Analysis: analysing and assessing the data entered and the dredging year calculated by WIT.

3. Planning: planning clusters of watercourses. Costs and quantities are clearly shown per dredging year.

4. Execution and data collection: carrying out the dredging works and collecting data on the new situation and sending it to the office.

5. Updating: updating WIT by processing dredged watercourses, entering recent measurement data and refining the dredging cycle.

Water bed in focus

Tijhuis Ingenieurs has developed the field work application for efficiently and accurately recording water bed data, covering both quality and quantity.

WIT brings the water bed into view.

WIT: one application for collecting all water bed data!

Benefits of the online management system WIT

• Insight into the maintenance obligation

• Building a digital archive

• Central data storage

• Easy adjustment of the planning

• Immediate insight into the effect on costs when the planning is adjusted

• Better control of, and feel for, the water system

• Helps coordinate work in the public space by giving colleagues access to the system

Tijhuis Ingenieurs is a specialist in regional water management. We provide advice throughout the entire process, from investigation to implementation. We stand for practical and realistic solutions.

We invest in developing ICT products to carry out work more efficiently and smartly. Examples of Tijhuis products are:

• Tijhuis App WIT – application for collecting field data

• Water bed information system Tijhuis WIT

Fields of work

• Water beds and dredging

• Banks and civil engineering structures

• Ecology and water quality

• GIS and data processing

Services

• Field work

• Advice

• Contracts and tendering

• Supervision and monitoring of implementation

If you would like more information about the activities of Tijhuis Ingenieurs, please contact one of our advisers.
