Would you like to reread all the information about WIT?

Special features

WIT is divided into three modules: WIT Multi-Year Planning, WIT Data and WIT Execution. WIT Multi-Year Planning provides insight into the maintenance condition of the watercourses. WIT Data supports the process of preparing and tendering dredging projects. WIT Execution provides digital support for dredging works. All relevant information is made digitally available to the parties involved (contractor, supervisor, site manager and client).

Water bed data, such as cross-sections and analyses, are recorded digitally

The method of execution and processing of dredged material is defined

Digital multi-year planning of dredging maintenance, which is easy to adjust

Insight into annual costs

A dynamic system that easily shows the consequences of future policy changes

Visualised information and overview in profiles and tables

WIT supports the preparation and tendering of dredging projects

All parties have access to the same up-to-date information via WIT

During execution, progress is visible and special features are recorded digitally for the future

Advantages of WIT

Tijhuis Ingenieurs has developed the online management system to support dredging maintenance: WIT. This application has been built for the collection, processing, analysis, visualisation and storage of all water bed information.

Dozens of municipalities, water boards, provinces and other water managers already use WIT.
